Summary Statement

Full-stack software engineer with U.S. education and professional experience, holding a B.Sc. in Computer Science from the University of the Pacific. Experienced in designing, modernizing, and delivering full-stack applications, with work spanning cloud architecture, distributed system integration, application security, performance optimization, and legacy modernization. Proven ability to rapidly understand complex systems, translate business requirements into technical solutions, and take ownership from architecture and implementation through delivery.

Experience

KBZ Bank, Full-stack Engineer – Yangon, Myanmar April 2026 – Current

- **Redesigned the mobile experience of an existing HR system within my first 2 months**, creating role-oriented employee and manager dashboards around frequently used workflows and at-a-glance information, alongside mobile bottom-tab and navigation-stack-style navigation within the existing React SPA
- **Designed and delivered a public-facing Job Portal from requirements to QA on a ~1-month timeline**, using React and ASP.NET with ASP.NET Identity and SMS OTP authentication
- **Architected asynchronous data synchronization between a public-facing Job Portal and an internal recruitment system using Amazon SNS/SQS and MassTransit**, implementing full-state message snapshots and row-version checks to discard stale updates and maintain eventual consistency across independently deployed microservices
- **Designed and provisioned the Job Portal's AWS infrastructure using ECS, CloudFront, RDS, and S3**, supporting containerized application deployment, data persistence, and content delivery
- **Acted as the development team's technical coordinator and a liaison with the project BA**, translating business requirements into technical specifications and using AI-assisted engineering workflows to elaborate requirements, accelerate implementation, and validate delivered functionality against requirements
- **Built custom code analysis tools using Roslyn and the TypeScript Compiler API** to flag potentially unsafe authorization patterns, trace React pages through TanStack Query hooks to backend API endpoints for access-control reviews, and enforce frontend layout conventions

Caterpillar Inc., Software Developer – South Dakota, United States Dec 2023 – Dec 2025

- **Held full ownership of the modern engineering content management system project and multiple internal PowerApps applications**, working across requirements, implementation, testing, stakeholder coordination, deployment, and ongoing enhancements
- **Modernized a legacy .NET engineering content management system used by 500+ users and 10+ API integrations** into a Node.js/Express + React application with multi-tenant support while simplifying the architecture, preserving database and API compatibility and supporting PingFederate and Microsoft Entra authentication for apps and users across all APIs
- **Reduced average content search query times by over 80%** by replacing complex SQL stored procedures with dynamically constructed queries, enabling pagination and improving application performance

- **Rebuilt the legacy CMS frontend in React**, developing custom components including an engineering drawing viewer and Unity WebGL 3D model viewer to deliver a richer, responsive user experience
- **Owned the design and delivery of an incident management application used by 100+ users**, translating stakeholder requirements into a PowerApps solution with RBAC, offline support, responsive UX, Azure Logic Apps automation, and Power BI reporting
- **Reduced runtime of a .NET product image processing application by 70%** by minimizing filesystem access and simplifying LINQ queries, while delivering additional functionality including copyright metadata embedding

Stryker (Formerly Vocera), Net Dev CO-OP – California, United States May 2022 – Dec 2022

- Developed a web dashboard used by 10+ support engineers and managers that displays the availability of support engineers who are on-call using data from Salesforce

Projects

Gradiotronics, Senior (capstone) project – University of the Pacific

- Collaborated with Bioengineering students to build an Arduino-based in-sole pressure sensor designed to visualize pressure on the foot and discover gait-related issues of the wearer
- Developed a video-player-like web app that pairs with the Arduino sensor over Bluetooth, and enables visualization of real-time data or recording it and playing it back

Education & Skills

University of The Pacific – Stockton, California, United States Aug 2019 – May 2023

B.Sc. Computer Science, GPA: 3.80/4.00 – magna cum laude

- Received Recognition of Excellence in Engineering Design in Bioengineering for Senior Project

Skills & Tech: C#, TypeScript (TS), JavaScript (JS), SQL, HTML, CSS, ASP.NET/.NET, React, Node.js, Express, AWS (ECS, CloudFront, RDS, S3, SNS, SQS), Azure, Microsoft SQL Server, SQLite, REST APIs, Git, GitHub Actions, CI/CD, Linux, Roslyn, TypeScript Compiler API, Visual Studio
